Puppet Warp lets you use one canvas with a document and simulate the effect of a physical comic in order to better render its details. You can then zoom into and view a small area. The result is a kind of “super-zoom” for selected areas of an image. You can use it to decimate a frame of a movie and insert some additional scenes, or use it for composing a photo. I’ve tried this with some preview images for different comic books. I’ve also used it to help create a composition on my website. In this case, I’ve just made a square canvas to apply a specific “super-zoom” effect. My attempt to demonstrate this is limited, because the creator of this tool has done a far better job than I could. I think this is a very useful image editing option for comic books, but you can use it for any kind of graphic project. It’s also very quick to apply and is a great tool to make the image look good without changing any color or proportions. Just went through Lightroom 5 RC2, and I think my understanding is slightly off regarding the Smart Previews system. When you convert 3rd party jpegs to dngs, it only changes the thumbnail aspect. It’s not manipulating the jpg data in a way that it forces the change to dng. DNG is a format that will be able to be previewed in more ways than that. Regarding the use of jpegs in the smart preview system – Lightroom 3 didn’t use them to begin with. It was using jpegs as thumbnails because that was the way jpeg/dng is set up. It was a quick way of saving space on disk without losing

quality. Now, if you have a third party DNG thumb and you convert it, you are looking at the full dng. It's a format change, and that means that when the jpegs are used in the smart preview, it will essentially show you exactly what you'd see if you were using the full sized dng image. It's simply a "better" way of looking at the image.
