This column floor lamp is a modern twist on the classic lantern design, adding an eye-catching dash of contemporary style to the home as well as a practical solution to lighting woes. The lamp is compatible with LED bulbs, making it both environmentally friendly and energy-efficient. It is made clear for easy upkeep over the years.

Searching for the perfect floor lamp? You're in luck! We have the perfect selection of modern, industrial, and standing floor lamps to choose from. We carry adjustable floor lamps or standing pole floor lamps that are perfect for your home. Standing floor lamps are an essential part of any home. They create the perfect ambience to read, work on your computer or just relax in your living room. Floor lamps are also a great way to give additional light to your dining space or bedroom. If you're looking for a stylish standing floor lamp, or an industrial floor lamp to light up your space, check out our selection below. Decorative lighting is one of the easiest ways to refresh a room with little effort and money. Elevating your space with **modern floor lamps** that make a statement can easily add style and practicality to any room. There are many different types of **floor lamps** available, each offering its own unique look and feel. Depending on the style of the lamp and your individual lighting needs, there is sure to be an option that fits your home perfectly. Your **floor lamp** can't do all the work when it comes to pulling a room together. Opt for complementary decorative lighting throughout the entire space such as modern table lamps, flush mounts, wall sconces and pendant lights in similar finishes to tie to entire room together. **Floor lamps** have been a traditional way to provide strong light in a room for many years. A wide variety of designs and styles are available, using technologies such as led floor lamps, fluorescent floor lamps and halogen floor lamps. Floor lamps are often positioned either in the corner of a room or behind a seating area since the increased light is useful for performing activities, reading and so on. Floor lamps often double as floor reading lamps and some reading lamps are specifically designed for this purpose. Floor lights stand tall in a room and are much taller than other types of lamps. Usually the lamp head or light is at least at chest-height, through eye level or even taller than a standing person. **Tall lamps** are usually taller than

table lamps. The shade on the floor lamp shields your eyes particularly when it is close to eye level when standing. When seated, it sometimes becomes possible to see the interior or underside of the lamp, which may expose bulbs to the eyes. In this case the lamps are best placed further from where you are sitting, or behind you. Since tall standing lamps tend to be more substantial, with a larger base, tall pole lamps usually feature larger lampshades to maintain proportion. The floor lamp tends to cost more in general than e.g. a table lamp, and also tends to support a higher wattage of light bulbs. A standing lamp may feature 2 or 3 light bulbs, with a total wattage of 300 watts or more, providing a much stronger light in the room. This strong light output is useful for tasks and activities in the room. With tall lamps you can raise the level of light in any room using a standing lamp. Pole lights come in variety of styles. Floor lamps range in height anywhere from around 4 feet to several feet. They are known as "tall standing lamps" because in general they are quite tall, either a little shorter than an average person or slightly taller than an average person. A typical average floor lamp will likely be around 60-72" in height, i.e. 5 to 6 feet. Some types of floor lamps such as reading lamps and pharmacy lamps will usually be shorter, since they are designed to be used mainly when seated. The main categories of floor lamp sizes is as follows: Most floor lamps use some kind of light bulb, or a set of bulbs. More modern floor lamps may use screw-in LED bulbs or individual LED light elements mounted into the lamp itself. Once light is emitted from the lamp, the light can be manipulated in a few different ways: Not all floor lamps are alike and they are not all designed to produce the same kind of light, or to use the light in the same way. Different lamp shades aim the light in different ways. The functionality of the floor lamp may be different and so selecting the right kind is important based on how you need to use the light or what purpose it should serve. In a small or average-sized room, a single floor lamp may be sufficient as a complement to other light fixtures in the room. Usually floor lamps feature a brighter light than other lamps, and position it higher in the room producing more ambient reflected light off the walls and ceiling. In a medium-large or larger room you might want more than one floor lamp. Always consider how the lamp might be used in combination with other lights in the room. A floor lamp can light up a dark corner and radiate light into the room. It could be placed near to or behind seating so that you have light coming down from above where you need to use it for reading or crafts. It is a good idea not to place the floor lamp too close to other lamps as the floor lamp should radiate quite strong light in all directions. Consider the light fixtures in your room, such as overhead central lights, wall lights etc. Also consider what will happen at night when it is darker. Where will you spend most of your time in the room? Where do you need extra light the most? Many people will consider a floor lamp an additional layer of lighting used to brighten the room or to be used for localized tasks, either as a complement to the lighting fixtures already in the room, or in place of them. If your room is already quite strongly lit around the ceiling area due to light fixtures there, and if the lower portion of the room seems less lit, then perhaps a downward-lighting floor lamp would be a better choice than a torchiere. If the upper part of the room or the overall ambience is low, an upward-lighting floor lamp or torchiere may be a better option. If you plan to sit beneath the light of the floor lamp and plan the standing lamp to be close enough to light a book, or to perform crafts or other seated activities, then the lamp will need to be positioned close to the chair. A dedicated reading lamp is a good choice here, which may include a dimmable LED floor lamp head and perhaps a full-spectrum light bulb would be a good option to assist with vision. The reading lamp will need to provide light coming over your shoulder or from the side. Do not place it in front of you otherwise it will produce glare off the page. Most likely a lamp positioned at the side of the chair is idea. A regular floor lamp could shed light down below its lamp shade, or a dedicated reading lamp or pharmacy lamp could be adjusted to shine its light downwards over or to the side of you. If you are not as concerned to light a small focused area, and just want to make the whole room brighter, then positioning a floor lamp more towards a corner or side of the room should work. Light will reflect off the walls and ceiling and produce ambience. Particularly suited for this is a torchiere floor lamp which shines the light upward toward the ceiling on purpose so that it will be distributed more diffusely throughout the room. This can be a good option for casual living rooms, a dining room, a floor lamp in the bedroom or in an office.
