

Where To Buy Thistle Flowers

Pros: The texture of these silvery-blue thistle provides an elegant, stylistic touch to any floral arrangements. Thistles are strong, durable flowers that work well for boutonnieres, bouquets and centerpieces. The texture balances out masculine with the feminine to create eye-catching, visual interest. Plus this bloom makes for an unexpected surprise.

Cons: For the most part, this flower is well-behaved. While these can occasionally shed white pollen they generally cause no problems at all. FiftyFlowers offers beautiful bulk thistles for your DIY wedding or event! Thistle flowers are beautiful, unique blooms that make a great addition to any bouquet. Wholesale bulk thistle is a great way to get large quantities of this versatile plant. This unique flower is a great way to add texture and interest to your floral designs. So if you're looking for a great place to buy bulk thistle, FiftyFlowers is definitely the place to go based on our continuous love we have for helping you get the most out of your flowers. Thistles have a bad reputation for their spiny personality, but these formidable wildflowers shine as favorite nectar and host plants for many bees and butterflies, including swallowtails. Purple thistle (*Cirsium horridulum*) is a larval host for the Little metalmark (*Calephelis virginiensis*) and Painted lady (*Vanessa cardui*) butterflies. The seeds are an important food source for seed-eating birds. Purple thistle occurs naturally in pinelands and prairies; it is common along roadsides and in disturbed habitats. It typically blooms in summer and fall but may bloom year-round. Since 1991, Cascade Floral Wholesale has been the premier destination for cut wholesale flowers, bulk flowers, DIY flowers, hard goods, and hand-tied bouquets. Delivering flowers to Seattle, Washington, surrounding areas and NATIONWIDE. We are your go-to florist in Northville, Michigan.

Let us make your celebrations a bit more fragrant, colorful, and memorable. You can send flowers by choosing from the gallery of designs of flowers for Valentine's Day, Mother's Day, any day. **Please Note:** The photos here are examples of the 'Classic Ivory' style. The exact design and flowers will vary based on availability and the designer's interpretation of this arrangement. Bull thistle is a widespread biennial thistle originally from Europe and Asia, but now introduced throughout North America. Although it is intimidating in appearance and can sometimes form large infestations, this thistle is not as challenging to control as many others and is mainly a problem in hay fields and pastures. Bull thistle is also commonly found along trails, roads and vacant fields. Public and private landowners are not required to control infestations of bull thistle that occur on their property in King County. Bull thistle is a Class C Noxious Weed in Washington, first listed in 1988. Because control is not required in the county, it is on the list of Non-Regulated Noxious Weeds for King County. For more information, see Noxious Weed Lists and Laws or visit the website of the Washington State Noxious Weed Control Board. Bull thistle might be confused with native thistles as well as more serious noxious weeds such as milk thistle, a Class A noxious weed in Washington, and creeping thistle, a Class C noxious weed that is much more difficult to control. Bull thistle prefers sunny, open areas and can tolerate a wide range of conditions, from moist to dry soils, and is typically found in disturbed areas such as roadsides, trails, logged areas, vacant land, pastures and cultivated land. Overgrazed pastures are susceptible to bull thistle encroachment, and it can sometimes form dense stands that reduce productivity and stocking levels. Bull thistle may also dominate forest clear cuts and reduce growth of tree seedlings. **Prevention:** Bull thistle only reproduces by seed so prevention of seeding and taking care not to spread seeds are key to preventing new infestations. Contaminated hay is a primary means of spread of this species so be careful to purchase weed free hay or watch closely for new plants in the areas hay is kept or spread. Do not leave cut stems of flowering bull thistle on the ground because they are likely to form viable seed after they are cut. **Mechanical control:** Mowed thistles will produce new branches from basal buds but close cutting or cutting twice per season will usually prevent seed production and reduce the population over time. More more effective control, cut plants with a sharp shovel at 1-2 inches below the soil surface prior to flowering. If only one cutting a year is possible, cut when plants are in bud for best results. Cultivation and tilling can also be effective to control bull thistle. **Chemical control:** For information on herbicides and recommendations for control, please see the Pacific Northwest Weed Management Handbook. There are several herbicides that are effective on bull thistle, but it is important to carefully match the product with your site, local conditions and regulations, and other weed and land management issues, and always follow the label directions for the product you are using. If your site has animals grazing, please read instructions carefully on grazing restrictions. For grassy areas, it is best to use a selective broadleaf herbicide to keep the competitive grasses intact. After spraying, wait two weeks or more to give the herbicide time to

work. **Biological control:** The bull thistle seed head gall fly (*Urophora stylata*) lays eggs on closed flower buds in June and July. After hatching, the larvae burrow into the seed-producing tissues to feed, forming galls and reducing seed production. If the bull thistle population is large enough to support a good sized population of this insect, it can be an effective way to reduce seed production of the bull thistle. This insect will not get rid of the bull thistle, however, just reduce its impact. See the biological control page for more information.
